Related topic	FrobeniusTheorem
Defines	completely integrable
Defines	completely integrable distribution

In the following we will  $C^\infty$  when we say smooth.

**Definition.** Let  $M$  be a smooth manifold of dimension  $m$  and let  $\Delta$  be a distribution of dimension  $n$  on  $M$ . Suppose that  $N$  is a connected submanifold of  $M$  such that for every  $x \in N$  we have that  $T_x(N)$  (the tangent space of  $N$  at  $x$ ) is contained in  $\Delta_x$  (the distribution at  $x$ ). We can abbreviate this by saying that  $T(N) \subset \Delta$ . We then say that  $N$  is an *integral manifold* of  $\Delta$ .

Do note that  $N$  could be of lower dimension than  $\Delta$  and is not required to be a regular submanifold of  $M$ .

**Definition.** We say that a distribution  $\Delta$  of dimension  $n$  on  $M$  is *completely integrable* if for each point  $x \in M$  there exists an integral manifold  $N$  of  $\Delta$  passing through  $x$  such that the dimension of  $N$  is equal to the dimension of  $\Delta$ .

An example of an integral manifold is the integral curve of a non-vanishing vector field and then of course the span of the vector field is a completely integrable distribution.
